Locate the ruby documentation for methods File::path and File#path. How are they different?

File::path – returns the string representation of the path

File#path – returns the pathname used to create *file* as a string. The pathname may not point to the file corresponding to *file*. For instance, the pathname becomes void when the file has been moved or deleted

```ruby
File.new("testfile").path              #=> "testfile"
File.new("/tmp/../tmp/xxx", "w").path   #=> "/tmp/../tmp/xxx"
```
